

PRODUCT DATA SHEET – LE-DA4

Section 1. PRODUCT DESCRIPTION

MECHANICAL ANCHOR – LE-DA4

Mechanical anchor LE-DA4 consists of threaded rod bolt ended with expansion cone, expansion sleeve, hexagonal nut and washer. Threaded rod bolt, nut and washer are made of carbon steel and covered with SQ Ceramic coating, while the expansion sleeve is made of A4 stainless steel. Fixing is executed by tightening the nut with adequate torque which causes sliding of expansion sleeve over the expansion cone and creates a permanent anchorage. The anchor is ideal for fixing in urban and industrial environments, both indoor and outdoor: metal substructure of the facade, machines and equipment, montage of light and medium weight steel structures, handrails and storage racks.

Recommended for substrates:

 cracked and non-cracked, reinforced and non-reinforced concrete of C20/25 ÷ C50/60 strength class

Advantages:

- fast and simple installation by driving the anchor and tightening
- ready to carry full capacity immediately
- supplied assembled with the nut and washer
- seismic surveys
- fire resistance R30 R120

Mechanical anchor hold European Technical Assessment: ETA-20/0641

Section 2. METHOD OF INSTALLATION

- 1. Original mechanical anchors delivered by the manufacturer can be used only
- 2. Before installation check whether parameters of the substrate (where anchors are to be installed) conform to parameters of the substrate used in testing, based on which characteristic loading resistances of connections were determined (see table 1÷6)
- 3. Install anchors so that reinforcement of the substrate is not damaged
- 4. Before installation, indicate the drilling points where anchors are to be installed in accordance with installation guidelines
- 5. Then drill the holes in accordance with the parameters selected (diameter and depth of the hole), perpendicularly to the substrate (see table 1, 4)
- 6. Clean holes with SCF brush (min. 3x) and blow out clean with PCF pump (min. 3x)
- 7. Drive anchor into the hole by light hits of a hammer and then tighten the screw by applying an adequate torque (T_{inst}) using torque wrench (see table 1, 4)
- 8. Note that after the anchor is expanded, the washer under the nut should be pressed against the fixed member
